

MENTURA TETRA Tracker™

The MENTURA TETRA TRACKER™ follows the geographical location of field units, and provides the location information to Control Centre maps, as well as to client software on vehicle computers. The Tracker Client provides also convenient access to data applications, like database queries, route search and status reporting.

Mentura Group's TETRA Tracker is a proven solution for vehicle location management and providing seamless interaction between field units and the control room.

Benefits:

- Real-time vehicle location in Control Room, optimised map functions (raster and vector maps).
- Vehicle client (optional): GIS functions for mobile units. The patrols can see their own location, location of other units in the group and access address search and database query functions.
- Seamless status reporting from mobile units to Control Room map.
- Load history can be viewed and analysed to plan capacity investments based on real data.
- Network status can be distributed to user organisations in need to know about communications status in their area of operations, without revealing any sensitive information about other users.
- Proven solution: The TETRA Tracker is being used by large field organisations every day, for example the Finnish Police Force uses the system to track the complete field force (2000 units).
